BUSINESS ANALYST | SOLUTION DELIVERY | AI-ENABLED WORKFLOWS

Business Analyst with 9+ years' experience across technical business analysis, data analytics, solution ownership, change coordination, stakeholder engagement, and technical delivery support.

Currently working in Auckland Transport's Public Transport Data & Customer Information team as a subject matter expert for public transport schedule datasets and the IVU scheduling platform. I support accurate and timely customer-facing data delivery across channels including AT Mobile, Google Maps, operational tools, and the enterprise data warehouse.

I have proven ability to bridge technical and non-technical teams, coordinate complex operational and change activity, improve testing and data quality processes, and provide trusted SME input into major initiatives and software-related projects. I bring practical hands-on experience using AI tools to automate workflows, improve knowledge access, accelerate analysis, and increase business efficiency.

Core Strengths

- Business Analysis
- Stakeholder Engagement & Facilitation
- Solution Ownership
- Change Management & Change Control
- Vendor Management
- Requirements Gathering & Documentation
- Service Review & Process Improvement
- Testing Coordination & UAT Support
- Data Validation & Quality Assurance
- SME Support for Projects & Procurement
- AI-Enabled Workflow Improvement (Copilot, ChatGPT, Claude)
- SQL, Excel, Python
- Azure DevOps

PROFESSIONAL EXPERIENCE

Auckland Transport — Business Analyst, Public Transport Data & Customer Information

May 2022 – Present | Auckland, New Zealand

Scope of Role

Subject matter expert for Public Transport schedule datasets and Auckland Transport's PT scheduling system (IVU). Responsible for supporting accurate and timely publication of customer-facing PT data across internal and external platforms including AT Mobile, Google Maps, realtime operational tools, and the enterprise data warehouse.

Key Contributions

- Own and coordinate the end-to-end change management process for monthly timetable and network updates via Azure DevOps, ranging from minor stop or metadata changes to major service changes affecting large sections of the transport network.
- Support a delivery process where some timetable changes are months to years in the making, balancing late operational adjustments against the need to publish information early enough for customers to plan their journeys.
- Act as primary liaison between Auckland Transport and software vendor IVU Traffic Technologies, overseeing configuration, upgrades, issue resolution, and service performance.
- Provide technical support and testing leadership for the PT Data team, including SQL, Excel, and Python-based validation of GTFS datasets and development of test cases in Azure DevOps.
- Improved the testing approach by using AI-assisted Python and SQL scripting to load GTFS datasets into SQL and generate tester-ready tables, reducing reliance on slower manual loading and transformation methods.
- Built a further variation of this workflow that can ingest GTFS data directly from a web link into the same SQL environment, improving speed and usability for testers.
- Strengthened validation and testing processes, contributing to reduced data-related production issues over time.
- Act as intermediary between Auckland Transport and external developers on data publishing services and integrations, while providing SME input to support new project delivery.
- Conduct business analysis and service reviews of IVU usage, including contribution to business cases for future expansion and performance optimisation.
- Produced documentation explaining key team processes and mapped the end-to-end change control and deployment process, improving shared understanding across internal and external teams.

- Provide subject matter expertise to strategic transport initiatives including the National Ticketing solution, City Rail Link (CRL), and Community Connect / OpenLoop fare implementations.
- Represent the PT Data team within Auckland Transport's Growth & Optimisation group, promoting data-informed decision-making and operational excellence.
- Actively contribute to Auckland Transport's Microsoft 365 Copilot AI "Community of Practice", exploring AI-driven productivity, knowledge, and analytics improvements.
- Use AI tools including Copilot, ChatGPT, Gemini, Claude, and researcher-style agents to optimize and automate BAU processes, support market analysis for software procurement, compare solution options, and identify relevant case studies.
- Built a Copilot-based study agent grounded in ITIL training material, notes, and sample exams, enabling users to generate practice questions, verify answers, and reference source material.

Retail Performance — Analyst

September 2016 – November 2021 | Auckland, New Zealand

- Delivered analysis across mystery shopping and market research programmes, converting raw operational data into clear and actionable client insights.
- Reviewed and collated monthly store experience reports, producing executive summaries that highlighted key themes, trends, and issues for management consideration.
- Presented findings through graphs, tables, and concise written commentary to support decision-making and improve visibility of operational performance.
- Designed and maintained web-based forms and data collection structures to improve consistency and reporting quality.
- Acted as a key remote liaison for customer communication and support, building strong foundations in stakeholder management, reporting, and translating findings for non-technical audiences.

AI & DIGITAL CAPABILITY

- Practical experience using generative AI tools to improve research, drafting, learning, workflow efficiency, and structured problem-solving.
- Used AI-assisted Python and SQL generation to streamline GTFS data loading into SQL databases and create tester-ready outputs, reducing reliance on slower manual loading and transformation methods.
- Built workflow variants that ingest data directly from web links into SQL environments for faster test preparation and improved usability.
- Built a Copilot-based ITIL study custom GPT agent grounded in source material and sample exams that could generate questions, assess answers, and reference supporting content.

- Used AI research agents to support software procurement and market analysis by identifying vendors, comparable case studies, and options relative to current solution landscapes.
- Familiar with prompt design, iterative refinement, and the strengths and limitations of AI-generated outputs in business contexts.
- Strong interest in applying AI responsibly, with awareness of privacy, governance, and the need for human review.

EDUCATION

Auckland University of Technology (AUT)

Bachelor of Computer and Information Sciences (2015)

Double Major in Software Development and IT Service Science

Additional Training

- ITIL Foundations Certificate - PeopleCert (2026)
- Project Management Essentials (PMBOK) Course - Lumify (2024)
- Data Analyst in Python / SQL - Dataquest (2020)
- Ongoing self-directed upskilling in AI, LLM workflows, automation, and modern digital delivery
